EI MegaProbe Language

a bioinformatics langauge

Isaac H. Lopez Diaz[1]

[1]Department of Computer Science
University of Puerto Rico

March 9, 2026

Agenda

- Introduction
- Methods
- Current Results
- Conclusions
- Future Work

Introduction

- El MegaProbe Language: Statically-typed, ML-like language with bioinformatics primitives
- Help The Blueprint of Life project with a language that can handle large genome sequences

Methods

The language implementation follows the convention from Krishnamurthi [2].

- Lexing and parsing: parser combinators [1]
- Type Checking and Evaluating: Pattern Matching

Current Results

- An interpreter
- DNA and RNA sequences as primitives, and higher-order functions like transcribe DNA sequence and reverse complement.
- (minimal) Apache Arrow bindings for fast reading csv files and producing Apache Arrow Tables.

Conclusions

A fully functional interpreter has been built with most common programming constructs and primitives, with additional bioinformatics primitives and functions.

Future Work

- Necessary bindings to Apache Arrow
- The Plan Monad: How should we evaluate large dataframes? Laziness!
- Compile to GPU
